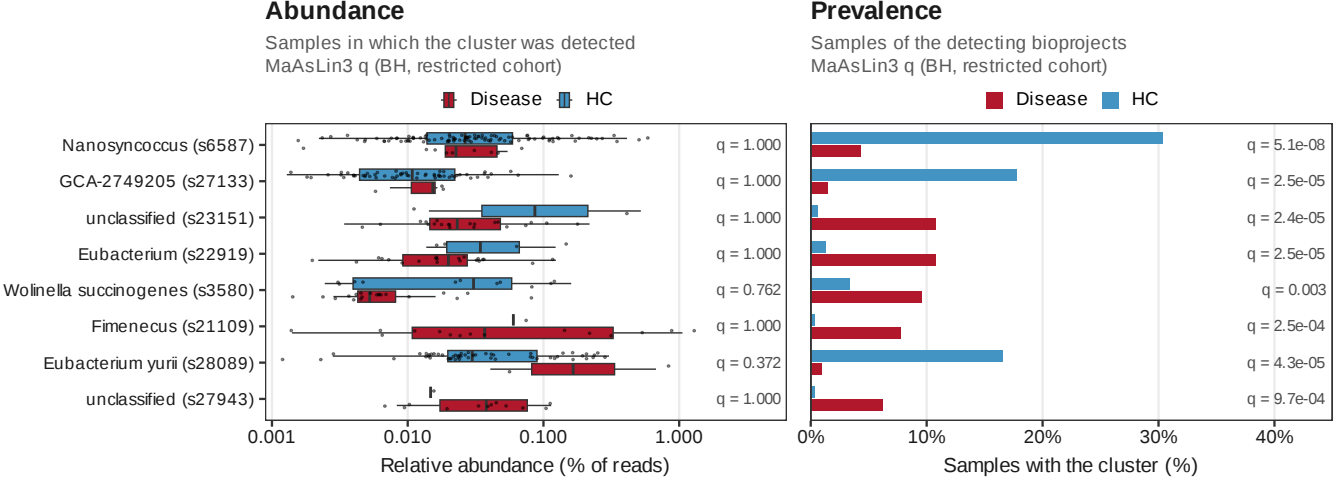
Head and Neck Cancer: clusters re-fitted on the cohorts that have controls


5 bioprojects with both cases and controls; 763 cases / 885 HC.
Of the 36 clusters significant in the full cohort, 12 occur in two or more bioprojects and 8 are shown; each shown row reaches q < 0.05 in at least one model (BH across the 8 shown, per model). Each row is tested, and its bars drawn, on the bioprojects where it was detected.
