Periodontal Disease: clusters re-fitted on the cohorts that have controls

18 bioprojects with both cases and controls; 1,063 cases / 1,138 HC.
Of the 13 clusters significant in the full cohort, 12 occur in two or more bioprojects and 12 are shown; each shown row reaches q < 0.05 in at least one model (BH across the 12 shown, per model). Each row is tested, and its bars drawn, on the bioprojects where it was detected.
